SUMMARY

Native Apple platform developer with 10+ years in technology, including three years of enterprise application development inside regulated New Mexico state government environments. Independent developer at Ramirez Labs, shipping iOS, macOS, and visionOS software built on Swift, SwiftUI, Vision, and Core ML with an on-device, privacy-first architecture. Cairn Skin is live on the App Store. Doctor of Computer Science candidate researching lightweight, on-device natural language to UI action mapping within Apple's ecosystem. Focused on healthcare, simulation, and training software.

INDEPENDENT DEVELOPMENT

Founder and Developer, Ramirez Labs

2026 to Present

Independent iOS, macOS, and visionOS development | ramirezlabs.app

Live on the App Store

Cairn Skin (iOS) (App Store). Privacy-first wellness photo journal for longitudinal body-area tracking. Built in Swift and SwiftUI on Apple's Vision framework, with all image data and computed feature vectors stored on-device and no network layer. Implemented ghost-overlay capture alignment, biometric app locking, per-area reminder scheduling through local notifications, PDF export, and a migration system that recomputes stored feature prints when the extraction pipeline changes. Diagnosed and resolved a Codable decoding failure that silently orphaned existing user data on schema change, adding a recovery path that rebuilds records from surviving entries. Removed a similarity-scoring feature after beta feedback showed the metric was dominated by lighting rather than subject, replacing it with a visual comparison grid. Distributed through TestFlight to external testers across seven builds before release.

In beta and in development

FloraFang (iOS, TestFlight beta). On-device plant and spider identification built around a confidence gate that withholds an identification when model certainty falls below threshold rather than guessing, and answers a narrower safety question: whether the subject belongs to a group that matters. Identification runs fully offline with zero network calls, and a separate flow routes ingestion incidents to poison control.

Kehai Care (iOS, TestFlight internal). On-device symptom triage. A small on-device language model does one narrow job, mapping free text to symptoms from a fixed list of twenty-five and showing the user what it heard for correction. The urgency decision is deterministic code following the Emergency Severity Index, where the most serious reported symptom wins and device readings can raise urgency but never lower it.

Peelback Mechanic (iOS and iPadOS, in progress). Diagnostic trouble code explorer that disassembles an engine layer by layer down to the components a code implicates. Scoped to the Toyota 1GR-FE V6, with a hand-verified map of 75 components against 43 fault codes.

Research and prototypes

B.E.T.H. (macOS). On-device voice assistant built on Apple's Foundation Models framework that maps natural language to system actions with no cloud dependency, and the research harness for my dissertation work. A completed pilot study measured intent routing accuracy across repeated trials and multiple OS builds, and isolated error concentration in referent-ambiguous inputs.

ClearChart (visionOS). Spatial clinical documentation prototype using SwiftUI and RealityKit, with live speech recognition mapped to structured clinical fields.

PROFESSIONAL EXPERIENCE

Jira Administrator / Application Developer

January 2026 to Present

New Mexico Health Care Authority (HCA), Santa Fe, NM

Administer Atlassian and Jama toolchains supporting software delivery across a compliance-heavy state health agency, managing permission schemes, access controls, and workflow configuration. Own enterprise release management, CI/CD, and workflow automation for the toolchain. Authored a detailed security outline for Jira board and project permissions delivered to agency leadership. Leading migration of agency source control from Bitbucket to GitHub, coordinating repository transfer, access provisioning, and continuity of developer workflows. Produce technical documentation and configuration records supporting operational and audit requirements. Coordinate with vendors and cross-functional teams on platform upgrades, integrations, and production support.

Application Developer

November 2023 to December 2025

New Mexico Taxation & Revenue Department, Santa Fe, NM

Developed complex T-SQL queries against Microsoft SQL Server to support legislative analysis, joining data across multiple databases and performing data cleanup to produce accurate results under legislative session deadlines. Worked in a branch-based development workflow on the FAST Enterprises tax platform, pulling code locally and promoting changes through development, test, staging, and production environments. Participated in peer code review as both author and reviewer, with emphasis on SQL correctness and data integrity. Served as technical lead for the statewide enterprise scanning software implementation, coordinating rollout across all state offices and partner locations. Supported and troubleshooted enterprise applications for a large, geographically distributed user base.

Firewall Engineer

February 2023 to November 2023

New Mexico Department of Health (DOH), Santa Fe, NM

Administered Palo Alto firewall infrastructure supporting 50+ state office locations statewide. Designed and deployed new firewall infrastructure for remote agency locations, managing configuration, testing, and implementation independently. Developed and enforced network security policies aligned with state IT governance and privacy standards.

Systems Engineer

2021 to February 2023

Nube Technology Solutions, Albuquerque, NM

Built and administered Windows Server and Active Directory environments for multiple client organizations, including DNS, DHCP, and Group Policy. Designed client network environments from the ground up including domain creation and endpoint provisioning. Advised clients on infrastructure planning, licensing, and technology procurement.

Earlier Experience

2016 to 2021

Progressive information technology roles spanning desktop support, systems administration, and infrastructure operations. Details available on request.

EDUCATION

Doctor of Computer Science, Cybersecurity and Information Assurance

2024 to Present

Colorado Technical University | In progress. Dissertation focus: lightweight, on-device natural language to UI action mapping within Apple's ecosystem.

Master of Science, Cybersecurity

Completed

Maryville University

Bachelor of Science, Applied Business Information Systems

Completed

Grand Canyon University

TECHNICAL SKILLS

Languages: Swift, T-SQL, SQL

Apple Frameworks: SwiftUI, SwiftData, Vision, Core ML, Foundation Models, RealityKit, Metal, Speech, AVFoundation, HealthKit, Observation

Apple Platform Development: Xcode, Xcode Instruments, Swift 6 concurrency, App Store Connect, TestFlight distribution, provisioning and code signing, on-device machine learning, privacy-first data architecture

Development Practices: Git, branch-based development, CI/CD, environment promotion pipelines, peer code review, AI-assisted development workflows, technical documentation

Databases: Microsoft SQL Server, multi-database queries, data cleanup and integrity validation

Enterprise Platforms: Jira Cloud, Confluence, Bitbucket, GitHub, Jama, SharePoint Online, Microsoft 365

Security and Compliance: Access control and permission design, network security policy, state IT governance and privacy standards
